

The Rotary Club of Romsey Test helped finance the design and production stage of the portable chair.

Since the initial design of a successful prototype in early 2008, Dentaïd has produced forty portable dental chairs which are now being used for dental out-reach programmes in remote rural communities around the world.

If you are interested in sponsoring a portable dental chair to be used for a specific project, or would like to purchase a chair please contact Dentaïd for more information.

For further information about Dentaïd's Portable Dental Chair please contact info@dentaïd.org or call 01794 324249

IMPROVING THE WORLD'S ORAL HEALTH

Portable Dental Chair

Dentaïd has designed and created a portable dental chair to be used in remote rural communities overseas.

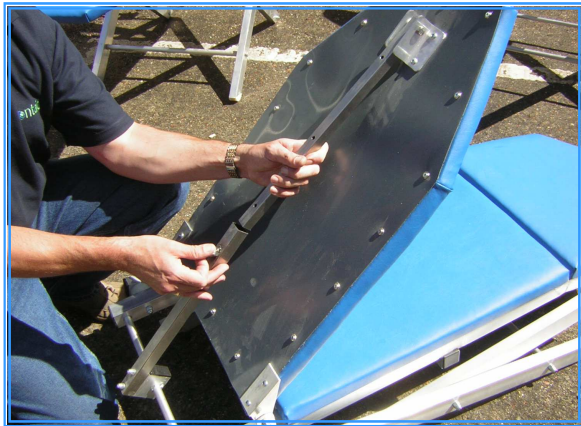

An adjustable dental chair is essential to the delivery of safe and effective dental treatment.

Many dentists offering outreach dental treatment in remote rural communities struggle to find a suitable dental chair to work with, particularly where there is no access to electricity.

Dentaïd's Portable Dental Chair is a low cost, easy to use and fully mobile chair designed specifically for in-field use.

By facilitating the supply of this Portable Chair we believe communities worldwide will benefit from improved oral health.

Approximate Sponsorship Costs

Portable Chair + Full Instrument Kit + Overseas Delivery	≈ £1000
Portable Chair + Overseas Delivery	≈ £750
Portable Chair with canvas cover	≈ £500

Technical Information

Height adjustable from 30 to 72cm
Maximum load 125Kg
Weight of the chair 22kg

Existing portable chairs can cost as much as £1300 which naturally prohibits their widespread use particularly for non-profit organisations. The Dentaid chair costs considerably less and has been designed specifically for community applications and functions. Dentaid has taken advice from several dentists, who have aided us in ensuring that the design is most suited to the performance of the dentist and the comfort of the patient alike.

Dentaid's portable chair was designed to be used in conjunction with the mobile instrument kits already introduced by Dentaid. These kits consist of basic instruments to be used to carry out extractions and simple dental treatments in rural areas and essential sterilisation.

The introduction of the portable chair increases the geographical range in which these treatments can be carried out. Oral health care workers will not be tied to a building but can perform the treatment literally anywhere.

The chair is fully collapsible and easy to transport by car, boat or plane.
